ATOMS

BOHR MODEL OF AN ATOM

Oxygen

Bohr's model of an atom:

- The atom is a small, neutral particle with a diameter of about 10^{-10} m.
- The nucleus is at the center and contains protons and neutrons.
- Electrons revolve around the nucleus in fixed orbits or shells.
- The number of electrons in each shell is fixed.
- The outermost shell is called the valence shell.
- The number of valence electrons determines the chemical properties of an element.

Properties of Bohr's model:

- It explains the stability of atoms.
- It explains the emission spectrum of atoms.
- It explains the periodicity of elements.
- It explains the formation of molecules.

Limitations of Bohr's model:

- It cannot explain the spectra of atoms with more than one electron.
- It cannot explain the fine structure of spectral lines.
- It cannot explain the Zeeman effect.
- It cannot explain the Stark effect.

A BRIEF GUIDE TO TYPES OF ORGANIC FORMULAE

MOLECULAR FORMULA

The molecular formula of an organic compound simply shows the number of each type of atom present. It tells you nothing about the bonding within the compound.

Empirical Formula

The empirical formula of an organic compound gives the simplest possible whole number ratio of the different types of atom within the compound.

Condensed Formula

The condensed formula is also text-based; here each carbon atom is listed separately, with atoms attached to it following. An exception is cyclic part or molecules e.g. benzene where the carbons are grouped.

Displayed Formula

A displayed formula shows all of the atoms and all of the bonds present in an organic compound; the bonds are represented as lines.

Structural Formula

Similar to displayed formula - not all bonds are shown although all atoms are often indicated using subscript numbers. Carbon hydrogen bonds are often simplified.

Skeletal Formula

In a skeletal formula, the hydrogen atoms are omitted from the formula; only the carbon and hydrogen are shown, leaving the rest to be inferred.

THE CHEMISTRY OF CHOCOLATE

IS CHOCOLATE AN APHRODISIAC?

Phenylethylamine occurs naturally in the brain and is dubbed 'the love drug' due to its ability to produce feelings of wellbeing and concentration. It is also present in significant concentration because it is broken down after ingestion, it has been ruled out as causing significant aphrodisiac effects.

Tryptophan is a chemical in the brain linked to the production of serotonin, the neurotransmitter that produces feelings of elation. It is present in chocolate.

WHY IS CHOCOLATE TOXIC TO DOGS?

Theobromine is a mild stimulant, similar in effect to caffeine, found in chocolate. This compound is harmless to humans at the levels found in chocolate - a fatal dose would require eating tens of kilograms of milk chocolate!

On cats & dogs, however, theobromine has a much more potent effect; small doses can lead to vomiting & diarrhoea whilst as little as 50g of dark chocolate could kill a small dog.

HYDROGEN BOND IN HAIRS

Hydrogen bonds are the most flexible bonds in hair. They are easily broken in the presence of water or heat. Hair sets flat - ironed hair - because the hydrogen bonds are manipulated. When we wet our hair, hydrogen bonds are disrupted. The water is left on layers or strands and held in place until it dries as the hydrogen bonds are reformed but in the new shape.

Why do old books turn yellow?

As it is made from wood, it contains cellulose and lignin. As lignin is converted to many products, it causes the yellowing.

CHEMICAL WARFARE TEAR GAS

Tear gas is a chemical warfare agent that causes tearing, pain, and even blindness. It is used by law enforcement to disperse crowds. It is also used in warfare to blind soldiers.

Perovskites: The Future Of Energy

Abhivarya Lotte, Sachal Magdam
(B.Sc-III, Chemistry, 2021-22)
Jaysingpur College, Jaysingpur

I. What is Perovskite

- Perovskites are discovered by Gustav Rose in 1839 and is named after Russian mineralogist Lev Perovskii.
- All materials with the same crystal structure as CaTiO_3 , namely ABX_3 , are termed perovskites (A: Organic or inorganic cation, B: divalent metal and X: halide).
- Example: Methylammonium lead iodide ($\text{CH}_3\text{NH}_3\text{PbI}_3$ = MAPbI₃)
- Historically, oxide-based perovskites (X=O) have been the most actively studied of perovskite family as result of their superior ferroelectric, magnetic and superconductive properties.

II. Perovskite Crystal Structure

Methyl ammonium crystal (MAPbI₃)

III. Perovskite Application

- Solar cell
- Photo detector
- Light emitting diode (LED)
- Radio detector
- Flexible Device

IV. Perovskite's Drawbacks

- Perovskites are toxic.
- Carcinogenic.
- Mental retardation in children.
- Perovskites are unstable when exposed to moisture, heat and UV-irradiation.

V. Future Challenges of Perovskite

- Improving efficiency to exceed Silicon solar cells.
- Increasing air and temperature stability.
- Replacing toxic Pb with a greener element.
- Fabricate large-area and flexible devices.

Who Discovered it???

History

Was discovered in 1772 by Solomon Lavoisier. He burned samples of charcoal and diamond and found that neither produced any water but released the same amount of carbon dioxide.

Graphite

Chemical Properties

- Graphite burns to form a gaseous carbon oxide.
- When oxygen concentration is increased during combustion, carbon burns to form CO₂.
- When carbon reacts with water with pressure with 3000 psi, it forms diamond.
- Carbon will react with halogens at high temperature.

Amorphous

Electronic Configuration of Carbon

Uses of Carbon

- Graphite is used in pencils.
- Carbon is used in a fuel.
- Carbon is used in jewelry.
- Electric motor.
- Diamond because they are hard and they are cutting, drilling, grinding and polishing.

Properties of Carbon

- Graphite: Black, lustrous, soft.
- Diamond: Transparent.
- Amorphous: Black.
- Fullerene: Black, spherical.
- Nanotubes: Black, cylindrical.
- Graphene: Black, single layer.

When to Find it???

- Carbon is found in the abundance in the stars and hot atmosphere.
- Carbon is found in rocks or being together and human since 1772.
- Diamond was found in South Africa & Ukraine.
